

The Instant Traffic and Weather stations that are offered by XM are VASTLY superior to any similar offerings delivered by over-the-air outlets in the San Francisco Bay area. Their accuracy and frequency help listeners avoid traffic delays, which I am confident helps to reduce pollution and further traffic disruptions caused by collisions in a congested environment. What POSSIBLE logic could be used to limit these valuable services? There should not be any sort of government throttled regulation of helpful and socially benign information; let's allow the free market system to determine what services make sense for broadcast!

Thank you,
Kevin Nathanson
